

# Test Your Website's Weak Spots

A **cyberattack** could be **extremely costly** for **your company**, with the average financial cost to large businesses being a whopping **£20,000**.

But you won't only lose money, you'll also lose your customers' trust. And as a result, your hard-earned reputation.

# Examine Your Website's Security Errors - Before the Hackers

With Website Vulnerability Exploitation from MTH Networks, your system's identified vulnerabilities are exploited. Simulating an everyday cyberattack, this penetration process exposes how easily your information can be taken. So you can prioritise the action needed to plug any holes and ensure your site is secure.

## Protect Your Website & Your Reputation

Provided you've had a Website Vulnerability Scan carried out within the last month, we can perform a penetration test on your website or web application. Whether you're a website owner or a developer, our team of in-house security experts will provide you with a complete assessment of your website's security.

## Penetration Process

Using interactive tools and scripts, your website's identified vulnerabilities will undergo an attempted exploitation. This rigorous process attempts to penetrate the weaknesses found in your website to verify vulnerabilities, find false positives and to highlight hard to exploit flaws. The time this takes depends on the number of vulnerabilities found.

## Determine Your Deficiencies

The Website Vulnerability Exploitation process is your next step following the Website Vulnerability Scan. We can show you where hackers could infiltrate your site and what areas need patching to make your system secure.

## Keep Your Customers Safe

Under the General Data Protection Regulation, it's your responsibility to ensure the security of your customers' personal data. Detecting vulnerabilities and areas of potential penetration in your system will help you avoid a costly data breach.

As cyber criminals become more sophisticated, attacking website vulnerabilities such as cross-site scripting, command injection and SQL injection vulnerabilities, can your company afford to be at risk?
